

Suggested questions for best practices

1. Ask everyone to think of one event, action or ongoing function in science for managing Parnu Bay that they think works or worked well. Give them a few minutes until nearly everyone has finish writing.
2. Ask them now to think about what the action or decision was that really made the difference so that this thing really worked.
3. Go around and have them give their experience and spend a short time answering questions about it. If discussion becomes general rather than asking about this experience then move to the next person.
4. If there is time ask people (without writing or going round) to identify what they have heard in the conversation as the most important practices for effective science.
